

Publishing and Sharing in Tableau

Q1. What is the key difference between publishing a dashboard on Tableau Public versus Tableau Server/Cloud in terms of accessibility and data security?

Ans. Tableau Public makes dashboards accessible to anyone on the internet and is not suitable for sensitive data. Tableau Server/Cloud allows organizations to restrict access to authorized users. It provides better security, governance, and permission controls. Therefore, confidential business data should generally be shared through Tableau Server/Cloud.

Q2. When publishing a Tableau dashboard, what happens to a live connection compared to an extract? How does this affect data refresh and performance?

Ans. A live connection queries the source database in real time whenever users interact with the dashboard. An extract stores a snapshot of the data. Live connections provide the most current data but may be slower. Extracts usually improve performance but require scheduled refreshes to stay updated.

Q3. In Tableau Server or Cloud, which feature allows administrators to control which users can view, interact with, or edit a published dashboard?

Ans. Administrators use Permissions and User Roles to control access. These settings determine who can view, interact with, edit, or manage dashboards. Permissions can be assigned to individual users or groups. This helps maintain security and proper governance.

Q4. If you want users to view a dashboard but not download the underlying data, which permission setting would you adjust in Tableau Server?

Ans. The Download Data permission should be adjusted. Administrators can disable this permission while still allowing users to view the dashboard. This prevents access to the underlying data. It helps protect sensitive information.

Q5. Name two methods by which a Tableau dashboard can be embedded into a web page or website.

Ans. A Tableau dashboard can be embedded using an iframe embed code. It can also be embedded using the Tableau JavaScript Embedding API. The iframe method is simple, while the API provides more customization and control. Both methods allow dashboards to be displayed on websites.

Q6. List two best practices you should follow when preparing a dashboard for public sharing to ensure data security and privacy.

Ans. Remove or mask sensitive and confidential information before publishing. Apply proper permissions and access controls wherever possible. Review data sources carefully to ensure no private data is exposed. Share only the information necessary for the audience.

Q7. After publishing a dashboard, users report a 'Data not found' error. What is the most common cause related to data source settings?

Ans. The most common cause is a broken or incorrect data source connection. The server may not be able to locate the database or file. Missing credentials can also cause this issue. Updating the connection settings usually resolves the problem.

Q8. When embedding a Tableau dashboard into a secure internal portal, what two additional security measures should be implemented?

Ans. User authentication such as Single Sign-On (SSO) should be implemented. Role-based permissions should also be used to control access. These measures ensure that only authorized users can view the dashboard. Secure HTTPS connections should also be used.
