

Excel Basic Assignment Question

1. Explain the difference between Relative, Absolute and Mixed Cell Referencing. You have the following dataset:

Vehicle	Price
Car	500000
Bicycle	10500
Auto-Rickshaw	25000

Ans. Relative reference

Relative reference is following when you copy this formula down from car to bicycle, the formula automatically moves down to the next row to find the new price.

Absolute reference

The absolute reference by adding a \$ sign to fix the particular cell where you can fix the cell to find value, you lock the anytype of formula to one specific cell.

Mixed reference

Using the mixed reference is the most efficient way to build a Tax table. It allows one single formula to calculate the tax for the car, bicycle, and auto-rikshaw across multiple different tax percentages all at once.

2. Write a formula to calculate the total sales of Car and Bicycle only.

Ans. =SUM(B2+B4)

3. Using the data below, write a formula to calculate the average sales of items priced above 100 but less than 300:

Item	Price	Sales
Item A	90	1000
Item B	150	1200
Item C	250	1500

Ans. 1350 is the average sales of item price of above 100 and less then 300

Formula use example - =AVERAGEIFS(C2:C4, B2:B4, ">100", B2:B4, "<300")
